

# Multiple Side Linear Equations and Circuit Lattices

Igor Semaev  
University of Bergen  
Norway

CECC, 25 June 2009

# Problem

- ▶  $X$  Boolean variable set, size  $n$
- ▶  $f_i$  Boolean polynomials in  $X_i \subseteq X$
- ▶ Find all 0, 1-solutions to

$$f_1(X_1) = 0, \dots, f_m(X_m) = 0$$

- ▶ were  $|X_i| \leq l$  for small  $l = 3, 4, \dots$
- ▶ No other restrictions
- ▶ E.g. TRIVIUM: 951 Boolean variables and equations
- ▶ each depends on 6 variables

# Zakrevskij-Raddum Representation of Equations

- ▶ In [Zakrevskij,1999]
- ▶ Independently [Raddum,2004]
- ▶  $f_i(X_i) = 0 \Leftrightarrow$  solutions  $V_i$  in variables  $X_i \Leftrightarrow E_i = (X_i, V_i)$
- ▶ E.g.

$$x_1 x_2 + x_3 \equiv 0 \pmod{2} \Leftrightarrow \begin{array}{r} x_1 \\ x_2 \\ x_3 \end{array} = \begin{array}{cccc} 0 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{array}$$

- ▶ Solve  $E_1, \dots, E_m$  by guessing some variable values and check by Pairwise Agreeing (a kind of simplification, called local reduction by Zakrevskij and graph algorithm by Raddum)
- ▶ Combine equations by Gluing [Semaev,2005]

## Agreeing-Gluing family

- ▶ Expected complexity much lower than worst case bounds, [Semaev,2007-08]
- ▶ Practically, Linear Algebra variant(MRHS) is far better than F4 in Magma
- ▶ E.g., more than 20000 times faster on AES-type random eqations with 48 Boolean variables, [Raddum-Semaev,2007]. MiniSat should be slow here, as the problem is not sparse in common sense
- ▶ Overcomes MiniSat in small sparsity, as 3,4,5, for randomly generated common sparse equations, [Schilling, in progress]
- ▶ Reasons for further development

# Contribution Outline

## Part I: New Gluing

- ▶ Coset Covers
- ▶ New representation: Multiple side linear equations
- ▶ New Gluing Algorithm

## Part II: Hardware Agreeing

- ▶ Fast pairwise agreeing [Raddum-Semaev,2007]
- ▶ Circuit Lattice Implementation
- ▶ DES and TripleDES equation systems

# Part I

## New Gluing Algorithm

## Motivating Example: Quadratics in Trivium

- ▶  $xy + u + v + w + z = 0 \Rightarrow$  Gröbner Basis Algorithms
- ▶ 32 solutions  $\Rightarrow$  Agreeing-Gluing or Sat-solvers
- ▶ MRHS lin. equation  $\Rightarrow$  MRHS routines [Raddum-Semaev,07]

$$\begin{array}{rcl} x & & 0 \ 0 \ 1 \ 1 \\ y & = & 0 \ 1 \ 0 \ 1 \\ u + v + w + z & & 0 \ 0 \ 0 \ 1 \end{array}$$

- ▶ MS linear equation [This talk]

$$\begin{array}{rcl} x & & 0 \\ u + v + w + z & = & 0 \end{array}$$

$$\begin{array}{rcl} x & & 1 \\ y + u + v + w + z & = & 0 \end{array}$$

# Coset Cover Problem

- ▶  $n$ -bit Boolean vector space  $S_n$
- ▶ Vector  $b$ , subspace  $U$ , coset  $b + U \subseteq S_n$ ,
- ▶  $V$  any subset in  $S_n$
- ▶ Problem: find a coset cover

$$V = \{b_1 + U_1\} \cup \dots \cup \{b_t + U_t\}$$

with minimal  $t = t(V)$ . Seems hard to solve for large  $n$

- ▶
  1.  $t(V) \leq \lceil \frac{|V|}{2} \rceil$
  2.  $t(V) \geq 2^{n/2-1}$  for some  $V$ , where  $n$  even
  3.  $n = 4$ , always  $t(V) \leq 4$
  4. and mean of  $t(V)$  is 2.71

# Represent Coset by Linear Equations

- ▶  $B = b + \langle u_1, \dots, u_r \rangle$  coset,  $\dim B = r$
- ▶  $n$ -variable column vector  $X$
- ▶  $B$  all solutions to  $AX = a$
- ▶ Matrix  $A$ :  $n - r$  rows and  $n$  columns
- ▶  $\text{rank}(A) = n - r$
- ▶ Point:
  1.  $AX = a$  more compact than  $B$
  2. easy to operate with linear algebra routines

# MS Linear Equation

- ▶  $f(X_i) = 0$  Boolean equation with low  $|X_i| = l$
- ▶  $V$  all solutions in variables  $X_i$
- ▶ Compute coset cover

$$V = \{b_1 + U_1\} \cup \dots \cup \{b_t + U_t\}$$

- ▶ Get MS linear equation

$$A_1 X_i = a_1$$

...

$$A_t X_i = a_t$$

## Example: one Boolean equation in 4 variables $X_i$

solutions in  $X_i$

cosets

MS linear equation

$$\begin{array}{cccc}
 & & & 0 \ 0 \ 0 \ 0 \\
 & & & 0 \ 0 \ 0 \ 1 \\
 0 \ 0 \ 0 \ 0 & & & 0 \ 1 \ 0 \ 0 \\
 0 \ 0 \ 0 \ 1 & & & 0 \ 1 \ 0 \ 1 \\
 0 \ 1 \ 0 \ 0 & & & \\
 0 \ 1 \ 0 \ 1 & \Leftrightarrow & 0 \ 1 \ 1 \ 1 \\
 0 \ 1 \ 1 \ 1 & & 1 \ 0 \ 1 \ 1 \\
 1 \ 1 \ 0 \ 1 & & \\
 1 \ 0 \ 1 \ 1 & & \\
 1 \ 1 \ 1 \ 1 & & 1 \ 1 \ 0 \ 1 \\
 & & 1 \ 1 \ 1 \ 1
 \end{array}
 \Leftrightarrow
 \begin{array}{c}
 \Leftrightarrow \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{pmatrix} X_i = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \\
 \\
 \Leftrightarrow \begin{pmatrix} 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix} X_i = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \\
 \\
 \Leftrightarrow \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} X_i = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}
 \end{array}$$

# Standard Gluing Algorithm

- ▶  $f_1(X_1) = 0$  with solutions  $V_1$  in  $X_1$
- ▶  $f_2(X_2) = 0$  with solutions  $V_2$  in  $X_2$
- ▶ Compute common solutions  $V$  to the system

$$f_1(X_1) = 0$$

$$f_2(X_2) = 0$$

in variables  $X' = X_1 \cup X_2$

- ▶ Apply to solve the whole system

## Gluing Running Time

- ▶ Characterized by  $T = (t_1, t_2, \dots, t_m)$
- ▶  $t_i$  - number of solutions to  $f_1(X_1) = 0, \dots, f_i(X_i) = 0$  in variables  $X_1 \cup \dots \cup X_i$ , for  $i = 1, 2, \dots, m$

- ▶ Asymptotic complexity under uniform instances distribution, [Semaev,2007]

$l$	3	4	5	6
max $t_i$ , expectation	$1.262^n$	$1.355^n$	$1.425^n$	$1.479^n$
Worst case [Iwama,2004]	$1.324^n$	$1.474^n$	$1.569^n$	$1.637^n$

## New Gluing Algorithm

- ▶  $f_1(X_1) = 0$  with  $A_1X_1 = a_1, \dots, A_tX_1 = a_t$
- ▶  $f_2(X_2) = 0$  with  $B_1X_2 = b_1, \dots, B_sX_2 = b_s$
- ▶ For each  $i, j$  triangulate

$$A_iX_1 = a_i$$

$$B_jX_2 = b_j$$

- ▶ Discard if inconsistent. Keep if consistent
- ▶ Produces the list

$$C_1X' = c_1, \dots, C_kX' = c_k$$

for common solutions in variables  $X' = X_1 \cup X_2$

- ▶ Apply to solve the whole system

# New Gluing Running Time

- ▶ Characterized by  $S = (s_1, s_2, \dots, s_m)$
- ▶  $s_i$  -number of linear systems for

$$f_1(X_1) = 0, \dots, f_i(X_i) = 0$$

produced with New Gluing Algorithm,  $i = 1, 2, \dots, m$

- ▶ Running time roughly  $\max s_i$ . Difficult to estimate in theory
- ▶ Compare  $T$  and  $S$  experimentally
- ▶  $n = m = 75$  and  $l = 4$ , uniformly random instance
- ▶ With Maple linear algebra routines

# Experimental Evidence

$T = (8, 34, 136, 1088, 2432, 19456, 38912, \dots, \mathbf{645404416}, \dots, 0)$

$S = (3, 7, 8, 24, 117, 351, 837, \dots, \mathbf{6733966}, \dots, 0)$

- ▶ Logarithmic scale; blue  $T$ -curve and red  $S$ -curve

- ▶  $S$ -curve is generated 4 times faster than  $T$ -curve
- ▶ New Gluing is faster

# Research Directions

- ▶ Get asymptotic complexity bound
- ▶ Develop a combination with Agreeing

## Part II

# Agreeing with Circuit Lattices

# Equation System Graph and Pairwise Agreeing

- ▶ **System:**  $f_1(X_1) = 0, \dots, f_m(X_m) = 0$
- ▶  $f_i(X_i) = 0 \Leftrightarrow$  solutions  $V_i$  in variables  $X_i \Leftrightarrow E_i = (X_i, V_i)$
- ▶ Connect  $E_i = (X_i, V_i)$  and  $E_j = (X_j, V_j)$  by
- ▶ Edge labeled  $X_i \cap X_j \neq \emptyset$

$$E_i \xrightarrow{X_i \cap X_j} E_j$$

- ▶ **Pairwise Agreeing.** Let  $Y \subseteq X_i \cap X_j$
- ▶ Learn ban  $Y \neq a$  from  $E_i$
- ▶ Expand to  $E_j$  through the edge
- ▶ Modify  $E_j$  accordingly

## Obsolescent Edges

- ▶ Remove some edges and keep Algorithm's output
- ▶ E.g.  $X_i = \{x_1, x_2, x_4\}$ ,  $X_j = \{x_1, x_2, x_3, x_5\}$ ,  $X_k = \{x_1, x_2, x_3\}$

- ▶ Left edges called maximal
- ▶ 16831 edges in Triple DES equation system initially
- ▶ 3929 maximal (left after removals)

## Fast Pairwise Agreeing (Agreeing2 method)

- ▶ For maximal edges  $(E_i, E_j)$
- ▶  $a_1, \dots, a_r$  and  $b_1, \dots, b_s$  solutions to  $E_i$  and  $E_j$  with the same projection to  $X_i \cap X_j$

- ▶ Pre-compute all  $\{a_1, \dots, a_r; b_1, \dots, b_s\}$

## Fast Pairwise Agreeing (Agreeing2 method)

- ▶  $a_i \neq$  part of a global solution  $\Rightarrow$  mark  $\bar{a}_i$
- ▶ For each tuple  $\{a_1, \dots, a_r; b_1, \dots, b_s\}$ :
- ▶  $\bar{a}_1, \dots, \bar{a}_r \Rightarrow \bar{b}_1, \dots, \bar{b}_s$  and vice versa  $\bar{b}_1, \dots, \bar{b}_s \Rightarrow \bar{a}_1, \dots, \bar{a}_r$
- ▶ Solving the system:
- ▶ Introducing a guess  $\equiv$  marking some of  $a_i$
- ▶ Expand marking through the tuples

# Example

## ► Equations

$$\begin{array}{c|ccc} & a_1 & a_2 & a_3 \\ \hline x_1 & 0 & 0 & 1 \\ x_2 & 0 & 1 & 1 \\ x_3 & 1 & 1 & 0 \end{array}, \quad \begin{array}{c|cc} & b_1 & b_2 \\ \hline x_1 & 0 & 1 \\ x_4 & 1 & 0 \end{array}, \quad \begin{array}{c|ccc} & c_1 & c_2 & c_3 \\ \hline x_2 & 0 & 1 & 1 \\ x_3 & 1 & 0 & 1 \\ x_4 & 1 & 1 & 0 \end{array}$$

## ► Tuples

$$\begin{aligned} & \{a_1, a_2; b_1\}, \quad \{a_3; b_2\}, \quad \{b_1; c_2\}, \\ & \{b_2; c_1, c_3\}, \quad \{a_1; c_1\}, \quad \{a_2; c_3\}, \\ & \{a_3; c_2\} \end{aligned}$$

## Example

- ▶ Assume  $x_4 = 0 \Rightarrow b_1$  should be marked(not a solution part)
- ▶ Implies marking expansion

- ▶ All instances(  $b_2$  at early stage) got marked
- ▶ The system is inconsistent for  $x_4 = 0$

# Circuit Lattice

- ▶ Hardware implementation of Agreeing2 method (different from hardware MRHS by Steinwandt, Geiselmann and Matheis)
- ▶ Circuit Lattice is a combination of switches and wires
- ▶ Two types of switches:

- ▶ Type-1 switch controls vertical circuit by the horizontal
- ▶ Type-2 switch controls horizontal circuit by the vertical

## Horizontal circuits

- ▶ Each local solution  $a \in E_i$  determines one horizontal circuit
- ▶ Type-1 and Type-2 switches are connected in parallel

- ▶ Endings are connected with a battery

## Vertical circuits

- ▶ Tuple  $T = \{a_1, \dots, a_r; b_1, \dots, b_s\}$  defines two vertical circuits

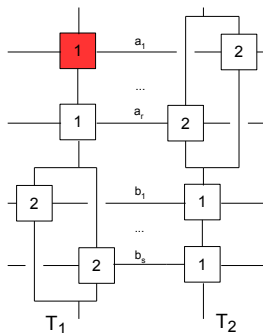

- ▶ Implement implications

$$\bar{a}_1, \dots, \bar{a}_r \Rightarrow \bar{b}_1, \dots, \bar{b}_s, \quad \bar{b}_1, \dots, \bar{b}_s \Rightarrow \bar{a}_1, \dots, \bar{a}_r$$

- ▶ All Type-1 switches closed  $\Rightarrow$  Voltage appears in a vertical circuit

## Vertical circuits

- ▶ Tuple  $T = \{a_1, \dots, a_r; b_1, \dots, b_s\}$  defines two vertical circuits

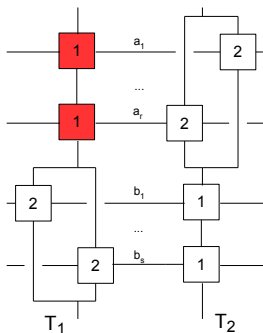

- ▶ Implement implications

$$\bar{a}_1, \dots, \bar{a}_r \Rightarrow \bar{b}_1, \dots, \bar{b}_s, \quad \bar{b}_1, \dots, \bar{b}_s \Rightarrow \bar{a}_1, \dots, \bar{a}_r$$

- ▶ All Type-1 switches closed  $\Rightarrow$  Voltage appears in a vertical circuit

## Vertical circuits

- ▶ Tuple  $T = \{a_1, \dots, a_r; b_1, \dots, b_s\}$  defines two vertical circuits

- ▶ Implement implications

$$\bar{a}_1, \dots, \bar{a}_r \Rightarrow \bar{b}_1, \dots, \bar{b}_s, \quad \bar{b}_1, \dots, \bar{b}_s \Rightarrow \bar{a}_1, \dots, \bar{a}_r$$

- ▶ All Type-1 switches closed  $\Rightarrow$  Voltage appears in a vertical circuit

## Vertical circuits

- ▶ Tuple  $T = \{a_1, \dots, a_r; b_1, \dots, b_s\}$  defines two vertical circuits

- ▶ Implement implications

$$\bar{a}_1, \dots, \bar{a}_r \Rightarrow \bar{b}_1, \dots, \bar{b}_s, \quad \bar{b}_1, \dots, \bar{b}_s \Rightarrow \bar{a}_1, \dots, \bar{a}_r$$

- ▶ All Type-1 switches closed  $\Rightarrow$  Voltage appears in a vertical circuit

## How horizontal circuit works

- ▶  $T = \{a, a_1, \dots, a_2; b_1, \dots, b_2\}$ ,  $S = \{a, a_3, \dots, a_4; c_1, \dots, c_2\}$
- ▶ Define

- ▶ Voltage in vertical  $T_2 \Rightarrow$  Type-2 switch closed
- ▶ Voltage in circuit  $a \equiv$  marking  $a$
- ▶  $\Rightarrow$  Type-1 switches closed
- ▶ Voltage(?) in new vertical circuit  $S_1$

## How horizontal circuit works

- ▶  $T = \{a, a_1, \dots, a_2; b_1, \dots, b_2\}$ ,  $S = \{a, a_3, \dots, a_4; c_1, \dots, c_2\}$
- ▶ Define

- ▶ Voltage in vertical  $T_2 \Rightarrow$  Type-2 switch closed
- ▶ Voltage in circuit  $a \equiv$  marking  $a$
- ▶  $\Rightarrow$  Type-1 switches closed
- ▶ Voltage(?) in new vertical circuit  $S_1$

## How horizontal circuit works

- ▶  $T = \{a, a_1, \dots, a_2; b_1, \dots, b_2\}$ ,  $S = \{a, a_3, \dots, a_4; c_1, \dots, c_2\}$
- ▶ Define

- ▶ Voltage in vertical  $T_2 \Rightarrow$  Type-2 switch closed
- ▶ Voltage in circuit  $a \equiv$  marking  $a$
- ▶  $\Rightarrow$  Type-1 switches closed
- ▶ Voltage(?) in new vertical circuit  $S_1$

## Introduce the guess

- ▶ Generally, no voltage in initial circuit lattice
- ▶ Assume  $E_i$  depends on  $x_j$
- ▶  $\{a_1, \dots, a_2\}$  solutions to  $E_i$ , where  $x_j = 0$
- ▶ Add Type-2 switch to each  $\{a_1, \dots, a_2\}$ , connect them
- ▶ Guessing  $x_j = 0$  is inducing voltage in new circuit
- ▶ Similarly, guessing  $x_j = 1$
- ▶  $s$ -variable guess -  $2s$  new vertical circuits

# Exemplary circuit

# 1st turn: introduce guess $x_4 = 0$

## 2nd turn

# 3rd turn

# 4th turn

# 5th turn: Observe Inconsistency

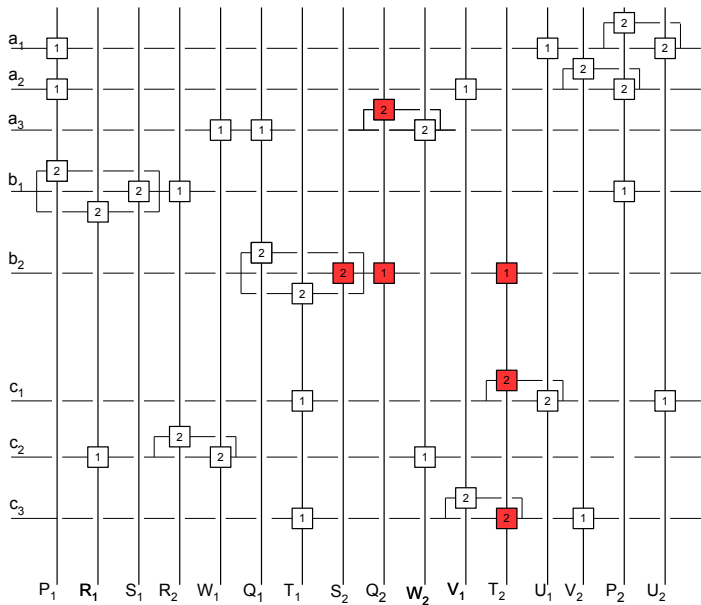

# 1st turn: introduce guess $x_4 = 1$

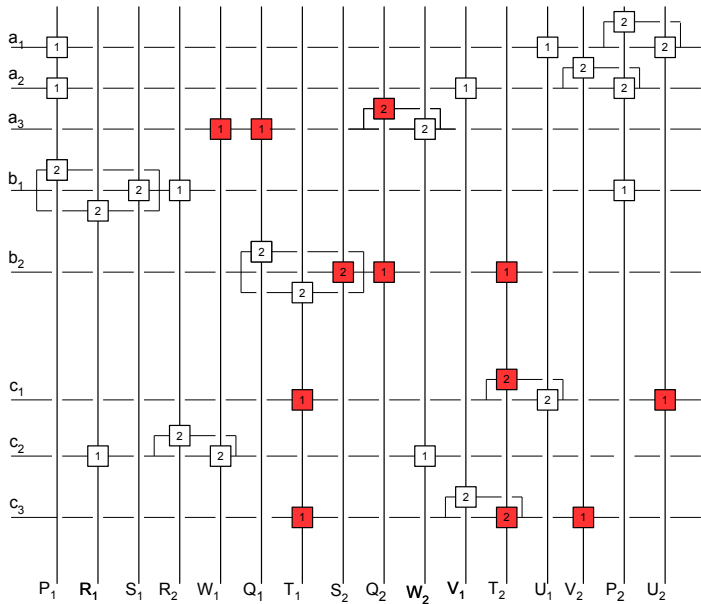

## 2nd turn

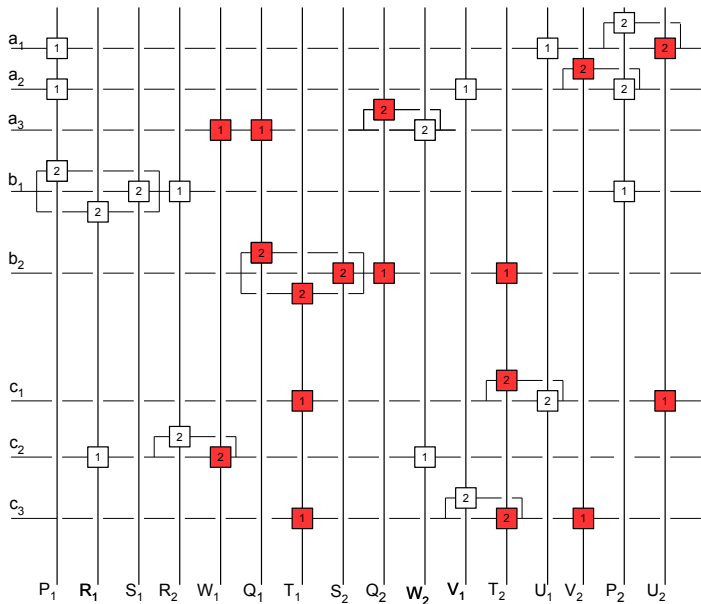

# 3rd turn

# 4th turn

# 5th turn: Observe Inconsistency

# DES and TripleDES equations

- ▶ Variables:
- ▶ 64-bit plain-text, cipher-text,
- ▶ internal state blocks and 56(112)-bit key
- ▶ Equations from  $S$ -boxes as

$$Y_4 \oplus Z_4 = S(X_6 \oplus K_6)$$

- ▶ Each equation: 20 variables and  $2^{16}$  RHS
- ▶ Study the system parameters

# TripleDES system parameters

- ▶ 1712 variables
- ▶ 384 equations
- ▶ 16831 edges
- ▶ 3929 maximal edges
- ▶ 71320 tuples
- ▶  $1.1 \times 10^9$  switches

# Implement on Modern Semiconductor Crystals?

- ▶ Transistor works as a switch
- ▶  $1.7 \times 10^9$  transistors on Dual-Core Itanium2 processor
- ▶ Circuit Lattice speed  $\leq 2 \times$ (number of rounds) transistor turns
- ▶ 96 turns for TripleDES
- ▶ One transistor turn, say 100GHz( 1000GHz reported)
- ▶ 1GHz key-rejecting rate when using for brute force
- ▶ Reported(2006) 0.13GHz with implementing encryption

# Research Directions

- ▶ Reduce the number of switches:
- ▶ Not all tuples are relevant
- ▶ Use switches that control many circuits.
- ▶ Estimate the number of turns necessary for solving general systems

# Conclusions

- ▶ Any Boolean problem with bounded number of variables is representable by MS linear equations
- ▶ New Gluing Algorithm is experimentally shown faster
- ▶ Using only maximal edges significantly economizes parameters
- ▶ Equation solving is shown as voltage expansion through a lattice of switches
- ▶ Our approach seems more flexible than implementing encryption as enables handling any equation system representing cipher
- ▶ Applications to DES, TripleDES are discussed
